WHAT IS VAN WHY DESIGN?

Van Why Design is a programming service specializing in VBA and VB.Net programming to customize Excel. I have been developing Excel tools for over 15 years and have developed a wide range of programs and plugins. The benefits realized from extending Excel's capabilities are far reaching and include:

- Adding functionality which may not currently exist
- Automation of processes
- Reduction in errors
- Software cost avoidance
- Time savings
- Improved work flow
- Reduced learning curve
- Process simplification

WHAT CAN BE ACCOMPLISHED?

The tools to customize Excel are extremely versatile and more capable than most people realize. I have developed programs from creating a custom function to a full application which includes its own menu system. Using VBA and VB.Net to customize Excel, you can achieve a program to do just about anything. A few of the programs I previously developed include:

- Program to automatically import and parse all .csv files in a selected folder. Over 200 .csv files could be imported in less than a minute saving over an hour a week.
- Program to automatically personalize emails to all clients listed in a spreadsheet. Each email was automatically generated.
- Program to Import an inspection dataset and generate inspection data maps to images imbedded in the workbook saving time generating images and streamlining the process.
- Program to automatically populate customer required forms from dimensional inspection results.
- Program to generate inspection report data for import and viewing in CAD to reduce the need to utilize CMM software and personnel to evaluate inspection results.
- Program to automatically download stock prices from a user specified list of ticker symbols eliminating manual lookup of individual stocks.
- Program to generate statistical evaluation of multiple inspection data files providing a capability not previously available.
- Program to export inspection results in .iges file format for general CAD viewing.
